

G II Solutions, Inc.

G II Solutions, Inc., established in 1983, began with a focus in the design and manufacture of custom automated machinery that performed a variety of functions. An expertise was developed in CNC and PLC integration as well as the manufacture of quality mechanical hardware. These custom systems were guaranteed from their installation to their successful operation with continuing technical support.

One particular project, in 1987, required the development of a customized wheel dressing and truing system for a customer who could not locate any such system in the standard marketplace. Subsequent research and design led to the successful development of a stand alone dressing machine which incorporated the use of an electric dressing and truing spindle maneuvered by a CNC controlled multi-axis precision table system. The success of this system, which is today still operational, followed by many years of development and improvement led to the birth of a complete line of rotary dressing and truing devices, the DTS spindles.

G II Solutions, Inc. now focuses primarily on the development and manufacture of the DTS spindles and systems that control them. Many different models have been developed based on various consumer demands throughout the years. Continuous analysis and redesign, high quality control in manufacture, and years of experience in a new field keep G II Solutions, Inc. on the leading edge of electric, rotary dressing and truing technology.
